

Business project

Main Idea:

Reels blocking and innovative ways to reduce screen time

Problem stakeholders:

Students

First take a sample survey

Reintervention 10 min or 15 min

Analysis of past few days of social media usage

Present it as a graph

Last opened or closed time

We can offer a setting where they can lock their settings and they set a target time and once that is over they cannot change

Daily targets to be reminded when using the app gentle

The app will be made open source

It will be full time chrome extension

When the screen time goes beyond the target set by the user the app will be given quotes to the user

Analysis of time saved through the app shows time saved by user everyday and encourages them to be so by giving micro reward

Offer detailed analysis over months and let users see trends over week or months

Identify time wasted by person everyday during what time in that what we do is suggest them to take hard lock mode

By creating widgets which show time spent productively vs time spent time on social media apps

The main motto is to to make user self realize and reduce their screen time

The user will set a focus session where they wont be able to access social media apps but if so clicked then it would subtly replaced with other exercises which naturally induces dopamine(white noise)they will be reward points.

A 2 week analysis of the users time on these apps would be taken and then after that each week how much time they are reducing accordingly they would be rewarded points through which they can climb leaderboards and compare with people of whos screen time is less

"Friction Layer." When a user tries to open a blocked app, insert a 5-10 second mandatory pause with a question: "What is your goal right now?" or "How much time do you want to spend?"

create "Study Rooms" where students can join a shared session. The app syncs a timer across all users in the room. If one person breaks their focus (opens a blocked app), they get a "strike," and the group sees a subtle notification. This builds peer accountability for free. (peer accountability)

Integrate with open source software with integrated group calls
This increases the chance they won't open Instagram.

Automatically generate a beautiful, easy-to-read PDF or email summary every Sunday.

- "You saved 45 minutes this week."
- "Your most productive day was Tuesday."
- "You avoided opening TikTok 12 times."
- Include a "badge" or achievement for the week.

"Parent/Teacher View." A parent can see a *summary* (not invasive details) of their child's progress: "Your child saved 3 hours this week."

The app color scheme is green , blue

Create a badge system and streaks as well

mood tracking and journaling.

prompt them to log *why* they wanted to open the app
After that show patterns and effective ways to come out of it

Allow teachers or club leaders to create a "Class Challenge." The whole class competes for the lowest screen time. The winner gets a digital certificate or a shoutout in the app.

Calculate a daily/weekly "Productivity Score" based on time saved, blocks respected, and focus sessions completed. Show how the user compares to the school average

Offer both Pomodoro (25/5) and Deep Work (90/20) timers. Integrate them with the blocking system so that during a Deep Work session, *nothing* is accessible except essential tools.

The problem:
Students wasting time

The 10 sec solution:

Use the app to come out of ur phone and avoid distractions

Clear solution:
Creating an open source app to make productivity a system.

Business Project Pitch: The Ultimate Screen-Time Reduction Ecosystem

1. Project Identity & Identity Framework

Concept Hook: Action $\implies$ Value. Moving students from passive scrolling to active living.

- **Project Category:** Digital Wellbeing / EdTech Utility
- **Target Audience (Stakeholders):** Students, Parents, and Teachers/School Administrators.
- **App Color Scheme:** Clean, calming **Green and Blue** palette to promote focus and reduce digital anxiety.
- **Core Philosophy:** Open-source, affordable, student-focused, built for local contexts, and highly inclusive.

2. The Problem & The "10-Second" Hook

- **The Problem:** Students are wasting critical hours daily on short-form content (Reels/TikTok), severely destroying attention spans and academic focus.
- **The 10-Second Solution:** A full-time open-source Chrome extension and app that instantly breaks the dopamine loop, forcing users to step away from their screens and eliminate distractions seamlessly.

3. Core Product Features & Workflow

The Friction Layer & Hard Lock Mode

Instead of standard blockers that are easily bypassed, this system introduces intentional psychological friction:

- **The Mandatory Pause:** When a blocked app is opened, a mandatory 5–10 second pause triggers, asking: *"What is your goal right now?"* or *"How much time do you want to spend?"*
- **Hard Lock Mode:** Users set a target time. Once that limit is breached, the settings lock completely. No overrides allowed.
- **Dopamine Replacement:** If a student attempts to click a blocked social app during a focus session, the interface subtly replaces the feed with micro-exercises that naturally induce dopamine (e.g., white noise sessions, quick breathing) while awarding them productivity points.

Peer Accountability: "Study Rooms"

- **Synced Timers:** Students join shared virtual study rooms with an integrated open-source group calling system.
- **The Strike System:** If one person breaks focus and opens a restricted app, they receive a "strike," and the entire group receives a subtle notification. This builds effortless, free peer accountability.

Insights & Gamification

- **Weekly Summaries:** Every Sunday, the app automatically generates a beautiful, easy-to-read PDF or email summary detailing metrics like: *"You saved 45 minutes this week,"* or *"You avoided opening TikTok 12 times."*
- **Productivity Score:** A calculated daily/weekly score based on time saved, blocks respected, and focus sessions completed, allowing users to see trends over weeks or months.
- **Integrated Timers:** Built-in support for both Pomodoro (25-minute focus / 5-minute break) and Deep Work (90-minute focus / 20-minute break) frameworks.

4. Market Fit & School Integration Matrix

Feature	Student Value	Institutional/Parent Value
Gamified Leaderboards	Climb ranks, maintain streaks, and win badges based on reduced screen time.	Class Challenges: Teachers/club leaders host competitions for lowest screen time; winners get digital certificates.
Productivity Widgets	Live home-screen widgets comparing productive time vs. social media time.	School Benchmarking: Shows how a student compares safely to the school average.
Mood Tracking	Logs <i>why</i> they wanted to open a social app to find behavioral patterns.	Parent/Teacher View: A completely non-invasive, high-level summary (e.g., " <i>Your child saved 3 hours this week</i> ").

5. 90-Day Action Plan & Business Model

Go-To-Market Strategy

1. **Phase 1: The Initial Survey & Baseline (Days 1–30):** Take a sample survey of student social media usage. Track baseline data, including the last opened/closed times and historical usage trends, presenting it visually in clear graphs.
2. **Phase 2: The School Trial Program (Days 31–60):** Partner with a local school and an expert growth/learning coach to run a live trial. Collect raw student feedback to iterate on the workflow.
3. **Phase 3: Community Scaling (Days 61–90):** Launch the open-source Chrome extension widely, leveraging local partnerships and sponsors.

Monetization Strategy

- **The Micro-Fee Model:** Keep the application affordable and accessible to ensure maximum inclusion while utilizing a low-cost subscription or school-licensing micro-fee for advanced features (like the Parent/Teacher dashboard and Class Challenges)

Tagline

Action \$ \implies \$ Value: Brutally simple, student-focused screen control built for your local community.

Comparison Matrix

Based on the benchmarks outlined in your strategic blueprint, this matrix highlights how your solution directly addresses core user needs compared to standard market alternatives:

Evaluation Criteria	Standard Alternatives	Your Solution
Local Context & Relevance	Broad, generic global approach; lacks regional adjustments.	Designed specifically for local needs with targeted community relevance.
Affordability	Expensive premium paywalls or invasive data models.	Focused on an accessible, inclusive micro-fee model .

User Need Alignment	Easy to bypass; relies purely on restrictive blocks that cause frustration.	Directly delivers value from action by substituting habits with healthy alternatives.
School & Institutional Applicability	Individualistic; hard for schools to adopt or scale collectively.	Engineered for seamless school-level adoption through collaborative challenges.

Inclusivity	Limited accessibility features.	Built from the ground up to be highly inclusive across all student demographics.
--------------------	---------------------------------	---

Step-by-Step Workflow

The application functions on a direct, friction-based sequence designed to intercept unconscious scrolling loops and convert distraction into immediate cognitive value:

1. **The Intention Intercept (Friction Layer):** When a student attempts to open a restricted social media application, a mandatory 5–10 second pause is instantly triggered. The app prompts them with a brutal, simple question: *"What is your goal right now?"* or *"How much time do you want to spend?"*.
2. **Behavioral Logging:** The user quickly logs their current mood or reason for opening the app to trace long-term behavioral patterns.

3. **Hard Lock & Redirection:** If a preset focus session is active, access is completely denied. The interface subtly replaces the scrolling feed with focus-inducing alternatives (like white noise exercises) that naturally reward the brain.
4. **Peer Accountability Sync:** If working within a shared "Study Room," the student's timer is synced across group members. Any drop in focus sends a subtle notification (a strike) to the room to maintain free peer accountability.
5. **Data to Graph Visualization:** The application tracks the daily reduction in screen time over weeks and months. Every Sunday, it compiles this into a clean, automated PDF summary charting progress, badges earned, and exact hours saved.

The Final Hook

To create a lasting final impression, the pitch connects your product directly back to its overarching theme using a striking conceptual metaphor derived from your system formulas:

$$\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$$

In classic optics, tracking an object distance (u) and an image distance (v) allows you to find the exact focal length (f) required to clear up a blurry picture.

Applying this formula directly to student life:

- Let u represent the real-world distance a student stands from their daily distractions.
- Let v represent the distance to their immediate academic and personal goals.

When these values are unbalanced, a student's daily routine loses clarity. This ecosystem functions as the definitive lens framework. By introducing intentional friction, it realigns the user's distance from distractions, shifting their day-to-day operations from aimless scrolling to measurable output. The final impression left on the user, parent, and educator is clear: **Action $\implies$ Value**. It brings an entire generation of distracted students back into sharp, absolute focus.
